## Online Appendix for:

# Testing Ambiguity Models through the Measurement of Probabilities for Gains and Losses 

Aurélien Baillon and Han Bleichrodt

## A - Test of models

## A.1. Maxmin expected utility (MEU) and Maxmax expected utility

Lemma 1: For all disjoint events $E$ and $F, \inf \left(\mathrm{I}_{\mathrm{E}}\right)+\inf \left(\mathrm{I}_{\mathrm{F}}\right) \leq \inf \left(\mathrm{I}_{\mathrm{E} \subset \mathrm{F}}\right)$ and $\sup \left(\mathrm{I}_{\mathrm{E}}\right)+\sup \left(\mathrm{I}_{\mathrm{F}}\right) \geq \sup \left(\mathrm{I}_{\mathrm{E} \cup \mathrm{F}}\right)$.

Proof: This can be deduced from the definition of $\mathrm{I}_{\mathrm{E}}$ (see main text).

Result 1. MEU predicts $\mathrm{BC}^{-}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{+}(\mathrm{E})=-\mathrm{BC}^{-}(\mathrm{E})$.

## Proof:

Under MEU, $\mathrm{BC}^{-}(\mathrm{E})=1-\sup \left(\mathrm{I}_{\mathrm{E}}\right)-\sup \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)$ and $\mathrm{BC}^{+}(\mathrm{E})=1-\inf \left(\mathrm{I}_{\mathrm{E}}\right)-$ $\inf \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)$

Lemma 1 (with $\left.\sup \left(\mathrm{I}_{\mathrm{s}}\right)=\inf \left(\mathrm{Is}_{\mathrm{s}}\right)=1\right)$ implies that $\mathrm{BC}^{-}(\mathrm{E}) \leq 0, \mathrm{BC}^{+}(\mathrm{E}) \geq 0$, and hence, $\mathrm{BC}^{-}(\mathrm{E}) \leq \mathrm{BC}^{+}(\mathrm{E})$. Moreover, $\sup \left(\mathrm{I}_{\mathrm{E}}\right)=1-\inf \left(\mathrm{I}_{\mathrm{S}-\mathrm{E}}\right)$ and $\sup \left(\mathrm{I}_{\mathrm{S}-\mathrm{E}}\right)=1$ $-\inf \left(\mathrm{I}_{\mathrm{E}}\right)$ implies $\mathrm{BC}^{+}(\mathrm{E})=-\mathrm{BC}^{-}(\mathrm{E})$.

Result 2. MEU predicts $\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \geq 0 \geq \mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$.
Proof: Under MEU, $\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)=\sup \left(\mathrm{I}_{\mathrm{E}}\right)+\sup \left(\mathrm{I}_{\mathrm{F}}\right)-\sup \left(\mathrm{I}_{\mathrm{E} \cup \mathrm{F}}\right)$ and $\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$
$=\inf \left(\mathrm{I}_{\mathrm{E}}\right)+\inf \left(\mathrm{I}_{\mathrm{F}}\right)-\inf \left(\mathrm{I}_{\mathrm{E} \cup \mathrm{F}}\right)$. Hence, according to Lemma 1, $\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \geq 0$,
$\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \leq 0$, and, $\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \geq \mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$.

Result 3. MEU predicts $\mathrm{UA}^{-}(\mathrm{E}) \leq 0 \leq \mathrm{UA}^{+}(\mathrm{E})$.
Proof: Under MEU, $\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right)=\inf \left(\mathrm{I}_{\mathrm{E}_{\mathrm{j}}}\right)+\inf \left(\mathrm{I}_{\mathrm{Ek}}\right)-\inf \left(\mathrm{I}_{\mathrm{Ejk}}\right)$ and $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right)=$ $\sup \left(\mathrm{I}_{\mathrm{Ej}}\right)+\sup \left(\mathrm{I}_{\mathrm{Ek}}\right)-\sup \left(\mathrm{I}_{\mathrm{Ejk}}\right)$. Hence, according to Lemma 1, $\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right) \leq 0 \leq$ $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right)$.

Result 4. Under MEU, $\mathrm{TA}^{+}=\mathrm{ITA}^{-} \leq 0 \leq \mathrm{TA}^{-}=\mathrm{ITA}^{+}$
Proof: Under MEU, TA ${ }^{+}=\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)-1$ and $\mathrm{ITA}^{-}=2-$ $\sup \left(\mathrm{I}_{\mathrm{E} 12}\right)-\sup \left(\mathrm{I}_{\mathrm{E} 23}\right)-\sup \left(\mathrm{I}_{\mathrm{E} 13}\right)=\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)-1$ because $\sup \left(\mathrm{I}_{\mathrm{E} 12}\right)=1-\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)$.

Hence, $\mathrm{TA}^{+}=\mathrm{ITA}^{-}$
Moreover, Lemma 1 implies: $1=\inf \left(\mathrm{I}_{\mathrm{S}}\right) \geq \inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 23}\right) \geq \inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+$ $\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)$, and therefore, $\mathrm{TA}^{+}=\mathrm{ITA}^{-} \leq 0$.

Similarly, $\mathrm{TA}^{-}=\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)-1$ and $\mathrm{ITA}^{-}=2-\inf \left(\mathrm{I}_{\mathrm{E} 12}\right)-$ $\inf \left(\mathrm{I}_{\mathrm{E} 23}\right)-\inf \left(\mathrm{I}_{\mathrm{E} 13}\right)=\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)-1$ because $\inf \left(\mathrm{I}_{\mathrm{E} 12}\right)=1-$ $\sup \left(\mathrm{I}_{\mathrm{Ez}}\right)$.

Hence, $\mathrm{TA}^{-}=\mathrm{ITA}^{+}$
Moreover, Lemma 1 implies: $1=\sup \left(\mathrm{I}_{\mathrm{S}}\right) \leq \sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 23}\right) \leq \sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+$ $\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)$, and therefore, $0 \leq \mathrm{TA}^{-}=\mathrm{ITA}^{+}$.

All proofs for maxmax follow exactly the same steps, but replacing inf by sup and reciprocally. We omit them for the sake of brevity.

## A.2. $\alpha$-Maxmin

Result 5. Under $\alpha$-Maxmin with $\mathrm{I}_{\mathrm{E}}$ not being a singleton, $\mathrm{BC}^{-}(\mathrm{E}) \geq 0 \geq$
$\mathrm{BC}^{+}(\mathrm{E}) \Leftrightarrow \alpha \leq 1 / 2$ and $\mathrm{BC}^{-}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{+}(\mathrm{E}) \Leftrightarrow \alpha \geq 1 / 2$. Moreover, $\mathrm{BC}^{+}(\mathrm{E})=-$ $\mathrm{BC}^{-}(\mathrm{E})$.
Proof: Under $\alpha$-Maxmin:
$\mathrm{BC}^{-}(\mathrm{E}) \geq 0$
$\Leftrightarrow \alpha\left(\sup \left(\mathrm{I}_{\mathrm{E}}\right)+\sup \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)\right)+(1-\alpha)\left(\inf \left(\mathrm{I}_{\mathrm{E}}\right)+\inf \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)\right) \leq 1$
$\Leftrightarrow(2 \alpha-1)\left(\left(\sup \left(\mathrm{I}_{\mathrm{E}}\right)-\inf \left(\mathrm{I}_{\mathrm{E}}\right)\right) \leq 0\right.$
(because $\sup \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)=\left(1-\inf \left(\mathrm{I}_{\mathrm{E}}\right)\right)$ and $\left.\inf \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)=\left(1-\sup \left(\mathrm{I}_{\mathrm{E}}\right)\right)\right)$
$\Leftrightarrow \alpha \geq 1 / 2$ (because $\mathrm{I}_{\mathrm{E}}$ not being a singleton implies $\sup \left(\mathrm{I}_{\mathrm{E}}\right)>\inf \left(\mathrm{I}_{\mathrm{E}}\right)$ ).
Reversing all inequalities in the proof demonstrates $\mathrm{BC}^{-}(\mathrm{E}) \leq 0 \Leftrightarrow \alpha \geq 1 / 2$.
Similarly: $\mathrm{BC}^{+}(\mathrm{E}) \geq 0$
$\Leftrightarrow \alpha\left(\inf \left(\mathrm{I}_{\mathrm{E}}\right)+\inf \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)\right)+(1-\alpha)\left(\sup \left(\mathrm{I}_{\mathrm{E}}\right)+\sup \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)\right) \leq 1$
$\Leftrightarrow(2 \alpha-1)\left(\left(\inf \left(\mathrm{I}_{\mathrm{E}}\right)-\sup \left(\mathrm{I}_{\mathrm{E}}\right)\right) \leq 0\right.$
(because $\sup \left(\mathrm{I}_{\mathrm{S}-\mathrm{E}}\right)=\left(1-\inf \left(\mathrm{I}_{\mathrm{E}}\right)\right)$ and $\left.\inf \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)=\left(1-\sup \left(\mathrm{I}_{\mathrm{E}}\right)\right)\right)$
$\Leftrightarrow \alpha \leq 1 / 2$ (because $\mathrm{I}_{\mathrm{E}}$ not being a singleton implies $\sup \left(\mathrm{I}_{\mathrm{E}}\right)>\inf \left(\mathrm{I}_{\mathrm{E}}\right)$ ).
Reversing all inequalities in the proof demonstrates $\mathrm{BC}^{+}(\mathrm{E}) \leq 0 \Leftrightarrow \alpha \leq 1 / 2$
Moreover, it follows from $\sup \left(\mathrm{I}_{\mathrm{E}}\right)=1-\inf \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)$ and $\sup \left(\mathrm{I}_{\mathrm{S}}-\mathrm{E}\right)=1-\inf \left(\mathrm{I}_{\mathrm{E}}\right)$ that $\mathrm{BC}^{+}(\mathrm{E})=-\mathrm{BC}^{-}(\mathrm{E})$.

Result 6. Under $\alpha$-Maxmin, $\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \leq \mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \Leftrightarrow \alpha \geq 1 / 2$ and $\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$ $\geq \mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \Leftrightarrow \alpha \leq 1 / 2$. No further restriction on sign.

Proof:

| Set of priors | $\begin{aligned} & \mathrm{m}_{-\left(\mathrm{I}_{\mathrm{E}}\right)}= \\ & \mathrm{m}^{-}\left(\mathrm{I}_{\mathrm{Ej}}\right) \end{aligned}$ | $\mathrm{m}^{-}\left(\mathrm{I}_{\mathrm{Ejj}}\right)$ | $\operatorname{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$ | $\begin{aligned} & \hline \mathrm{m}^{+}\left(\mathrm{I}_{\mathrm{E} \mathrm{i}}\right)= \\ & \mathrm{m}^{+}\left(\mathrm{I}_{\mathrm{Ej}}\right) \end{aligned}$ | $\mathrm{m}^{+}\left(\mathrm{I}_{\text {Eij }}\right)$ | $\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\begin{aligned} & \mathrm{I}_{\mathrm{Ei}}=\mathrm{I}_{\mathrm{Ej}}= \\ & {[0 ; 1 / 2]} \\ & \text { and } \mathrm{I}_{\mathrm{Ejj}}= \\ & {[1 / 4 ; 3 / 4]} \end{aligned}$ | $1 / 2 \alpha$ | $\begin{aligned} & \hline 3 / 4 \alpha+(1 \\ & -\alpha)^{1 / 4} \end{aligned}$ | $\begin{aligned} & 1 / 2 \alpha-1 / 4 \\ & >0 \text { if } \alpha> \\ & 1 / 2 \\ & <0 \text { if } \alpha< \\ & 1 / 2 \end{aligned}$ | $(1-\alpha)^{1 / 2}$ | $\begin{aligned} & 1 / 4 \alpha+3 / 4 \\ & (1-\alpha) \end{aligned}$ | $\begin{aligned} & 1 / 1 /-1 / 2 \alpha \\ & <0 \text { if } \alpha> \\ & 1 / 2 \\ & >0 \text { if } \alpha< \\ & 1 / 2 \\ & \hline \end{aligned}$ |

$\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \geq \mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \Leftrightarrow$
$\alpha\left(\inf \left(\mathrm{I}_{\mathrm{Ei}}\right)+\inf \left(\mathrm{I}_{\mathrm{Ej}}\right)-\inf \left(\mathrm{I}_{\mathrm{Eij}}\right)\right)+(1-\alpha)\left(\sup \left(\mathrm{I}_{\mathrm{Ei}}\right)+\sup \left(\mathrm{I}_{\mathrm{Ej}}\right)-\sup \left(\mathrm{I}_{\mathrm{Ej}}\right)\right) \geq$
$\alpha\left(\sup \left(\mathrm{I}_{\mathrm{Ei}}\right)+\sup \left(\mathrm{I}_{\mathrm{Ej}}\right)-\sup \left(\mathrm{I}_{\mathrm{Eij}}\right)\right)+(1-\alpha)\left(\inf \left(\mathrm{I}_{\mathrm{Ei}}\right)+\inf \left(\mathrm{I}_{\mathrm{Ej}}\right)-\inf \left(\mathrm{I}_{\mathrm{Eij}}\right)\right)$
$\Leftrightarrow(2 \alpha-1)\left(\inf \left(\mathrm{I}_{\mathrm{Ei}}\right)+\inf \left(\mathrm{I}_{\mathrm{Ej}}\right)-\inf \left(\mathrm{I}_{\mathrm{Ejj}}\right)-\sup \left(\mathrm{I}_{\mathrm{Ei}}\right)-\sup \left(\mathrm{I}_{\mathrm{Ej}}\right)+\sup \left(\mathrm{I}_{\mathrm{Eij}}\right)\right) \geq 0$
$\Leftrightarrow(2 \alpha-1) \leq 0$ (by Lemma 1$) \Leftrightarrow \alpha \leq 1 / 2$.
Reversing all inequalities demonstrate $\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \leq \mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \Leftrightarrow \alpha \geq 1 / 2$.

Result 7. Under $\alpha$-Maxmin, $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right) \leq \mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right) \Leftrightarrow \alpha \leq 1 / 2$ and $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right) \geq$ $\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right) \Leftrightarrow \alpha \geq 1 / 2$. No further restriction on signs.

## Proof:

Under $\alpha$-Maxmin, $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right)=1-\inf \left(\mathrm{I}_{\mathrm{Eik}}\right)-\inf \left(\mathrm{I}_{\mathrm{Eij}}\right)+\inf \left(\mathrm{I}_{\mathrm{Ei}}\right)=\sup \left(\mathrm{I}_{\mathrm{Ej}}\right)+$ $\sup \left(\mathrm{I}_{\mathrm{Ek}}\right)-\sup \left(\mathrm{I}_{\mathrm{Ejk}}\right)=\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{j}}, \mathrm{E}_{\mathrm{k}}\right)$ and $\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right)=1-\sup \left(\mathrm{I}_{\mathrm{Eik}}\right)-\sup \left(\mathrm{I}_{\mathrm{Ejj}}\right)+$ $\sup \left(\mathrm{I}_{\mathrm{Ei}}\right)=\inf \left(\mathrm{I}_{\mathrm{Ej}}\right)+\inf \left(\mathrm{I}_{\mathrm{Ek}}\right)-\inf \left(\mathrm{I}_{\mathrm{Ejk}}\right)=\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{j}}, \mathrm{E}_{\mathrm{k}}\right)$. The result follows from the previous one.

Result 8. Under $\alpha$-Maxmin,
$\alpha \leq 1 / 3 \Rightarrow \mathrm{TA}^{-}=\mathrm{ITA}^{+} \leq 0 \leq \mathrm{ITA}^{-}=\mathrm{TA}^{+}$.
$1 / 3 \leq \alpha \leq 1 / 2 \Rightarrow$ TA $^{-}=$ITA $^{+} \leq$ITA $^{-}=$TA $^{+}$(no further restriction on sign).
$1 / 2 \leq \alpha \leq 2 / 3 \Rightarrow \mathrm{TA}^{+}=\mathrm{ITA}^{-} \leq \mathrm{ITA}^{+}=\mathrm{TA}^{-}$(no further restriction on sign).
$\alpha \geq 2 / 3 \Rightarrow \mathrm{TA}^{+}=\mathrm{ITA}^{-} \leq 0 \leq \mathrm{ITA}^{+}=\mathrm{TA}^{-}$.

## Proof:

$$
\begin{aligned}
& \text { Under } \alpha-\operatorname{Maxmin}, \mathrm{TA}^{+}=\alpha\left(\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)+(1-\alpha)\left(\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\right. \\
& \left.\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)-1=2-\alpha\left(\sup \left(\mathrm{I}_{\mathrm{E} 12}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 23}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 13}\right)\right)+(1-\alpha) \\
& \left(\inf \left(\mathrm{I}_{\mathrm{E} 12}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 23}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 13}\right)\right)=\mathrm{ITA}^{-} . \\
& \operatorname{Moreover,} \mathrm{TA}^{-}=(1-\alpha)\left(\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)+\alpha\left(\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)\right. \\
& \left.+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)-1=2-(1-\alpha)\left(\sup \left(\mathrm{I}_{\mathrm{E} 12}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 23}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 13}\right)\right)+\alpha\left(\inf \left(\mathrm{I}_{\mathrm{E} 12}\right)+\right. \\
& \left.\inf \left(\mathrm{I}_{\mathrm{E} 23}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 13}\right)\right)=\mathrm{ITA}^{+} . \\
& \mathrm{TA}^{+}>0 \\
& \Rightarrow \alpha\left(\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)+(1-\alpha)\left(\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)>1
\end{aligned}
$$

$$
\Rightarrow(3 \alpha-2)\left(\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)>(3 \alpha-2)
$$

(Using that Lemma 1 implies $\sup \left(\mathrm{I}_{\mathrm{E} 1}\right) \leq 1-\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)-\inf \left(\mathrm{I}_{\mathrm{E} 3}\right), \sup \left(\mathrm{I}_{\mathrm{E} 2}\right) \leq$
$1-\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)-\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)$, and $\left.\sup \left(\mathrm{I}_{\mathrm{E} 3}\right) \leq 1-\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)-\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)\right)$
$\Rightarrow(3 \alpha-2)<0$ (because $\left.0 \leq \inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)<1\right)$
$\Rightarrow \alpha<2 / 3$.
$\mathrm{TA}^{+}<0$
$\Rightarrow \alpha\left(\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)+(1-\alpha)\left(\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)<1$
$\Rightarrow(1-3 \alpha)\left(\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)<(1-3 \alpha)$
(Using that Lemma $1 \operatorname{implies} \inf \left(\mathrm{I}_{\mathrm{E} 1}\right) \geq 1-\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)-\sup \left(\mathrm{I}_{\mathrm{E} 3}\right), \inf \left(\mathrm{I}_{\mathrm{E} 2}\right) \geq$
$\left.1-\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)-\sup \left(\mathrm{I}_{\mathrm{E} 3}\right), \operatorname{and} \inf \left(\mathrm{I}_{\mathrm{E} 3}\right) \geq 1-\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)-\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)\right)$
$\Rightarrow(1-3 \alpha)<0$ (because $\left.1 \leq \sup \left(\mathrm{I}_{\mathrm{E} 1}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)+\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)$
$\Rightarrow 1 / 3<\alpha$.

Note that $\mathrm{TA}^{-}$is equal to $\mathrm{TA}^{+}$for which we would have exchanged $\alpha$ and (1$\alpha)$. Hence, $\mathrm{TA}^{-}>0 \Rightarrow(1-\alpha)<2 / 3 \Rightarrow 1 / 3<\alpha$ and
$\mathrm{TA}^{-}<0 \Rightarrow 1 / 3<(1-\alpha) \Rightarrow \alpha<2 / 3$.
As a consequence:
$\alpha \geq 2 / 3 \Rightarrow \mathrm{TA}^{+}=\mathrm{ITA}^{-} \leq 0 \leq \mathrm{ITA}^{+}=\mathrm{TA}^{-}$
and
$\alpha \leq 1 / 3 \Rightarrow$ TA $^{-}=\mathrm{ITA}^{+} \leq 0 \leq \mathrm{ITA}^{-}=\mathrm{TA}^{+}$.
Moreover, $\mathrm{TA}^{-}-\mathrm{TA}^{+}=(1-2 \alpha)\left(\inf \left(\mathrm{I}_{\mathrm{E} 1}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 2}\right)+\inf \left(\mathrm{I}_{\mathrm{E} 3}\right)-\sup \left(\mathrm{I}_{\mathrm{E} 1}\right)-\right.$
$\left.\sup \left(\mathrm{I}_{\mathrm{E} 2}\right)-\sup \left(\mathrm{I}_{\mathrm{E} 3}\right)\right)$. Then $\mathrm{TA}^{-} \leq \mathrm{TA}^{+} \Leftrightarrow \alpha \leq 1 / 2$.

Assume $1 / 3<\alpha<2 / 3$ :

| Set of priors | $\mathrm{m}^{-}\left(\mathrm{I}_{\mathrm{Ei}}\right)$ | $\mathrm{TA}^{-}=\mathrm{ITA}^{+}$ | $\mathrm{m}^{+}\left(\mathrm{I}_{\mathrm{Ei}}\right)$ | $\mathrm{ITA}^{-}=\mathrm{TA}^{+}$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{I}_{\mathrm{Ei}}=[0 ; 1]$ for <br> all i | $\alpha$ | $3 \alpha-1>0$ | $(1-\alpha)$ | $3(1-\alpha)-1>0$ |
| $\mathrm{I}_{\mathrm{Ei}}=[0 ; 1 / 2]$ for <br> all i | $1 / 2 \alpha$ | $3 / 2 \alpha-1<0$ | $(1-\alpha) 1 / 2$ | $3 / 2(1-\alpha)-1$ <br> $<0$ |
| $\mathrm{I}_{\mathrm{Ei}}=[0 ; 2 / 3]$ <br> for all i | $2 \alpha / 3$ | $2 \alpha-1$ | $2(1-\alpha) / 3$ | $1-2 \alpha$ |

## A.3. Variational model (VM)

In this section, we consider 3 given outcomes: $x, 0$, and $-x$ (where $x>0$ ).
We assume (without loss of generality) $U(x)=1, U(0)=0$, and $U(-x)=z$. with $\mathrm{z}<0$.

Result 9. VM predicts $\mathrm{BC}^{-}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{+}$(E).
Proof: From Eq.(7) in Maccheroni et al. (2006), the set $\{\mathrm{P} \in \Delta$ : $\mathrm{c}(\mathrm{P})=0\}$ is nonempty. Let $\mathrm{P}^{*}$ be such that $\mathrm{c}\left(\mathrm{P}^{*}\right)=0$. Let P be the probability measure that minimizes, for event $E, P(E) z+c(P)$. Then $P(E) z+c(P) \leq P^{*}(E) z$. Let $P^{\prime}$ be the probability measure that minimizes, for event, $E^{c} P^{\prime}\left(E^{c}\right) z+c\left(P^{\prime}\right)$. Then also $P^{\prime}\left(E^{c}\right) z+c\left(P^{\prime}\right) \leq P^{*}\left(E^{c}\right) z$.

Because $P^{*}$ is a probability measure, $P^{*}(E)+P^{*}\left(E^{c}\right)=1$. Consequently, $P(E) z+c(P)+P^{\prime}\left(E^{c}\right) z+c\left(P^{\prime}\right) \leq z$.

Dividing by z , which is negative, we obtain that the sum of the matching probabilities for $E$ and $E^{c}$ in the loss domain should be at least 1, and thus $\mathrm{BC}^{-}(\mathrm{E}) \leq 0$.

Now, let P be the probability measure that minimizes, for event $\mathrm{E}, \mathrm{P}(\mathrm{E})+\mathrm{c}(\mathrm{P})$.
Then $\mathrm{P}(\mathrm{E})+\mathrm{c}(\mathrm{P}) \leq \mathrm{P}^{*}(\mathrm{E})$. Let $\mathrm{P}^{\prime}$ be the probability measure that minimizes, for event $E^{c}, P^{\prime}\left(E^{c}\right)+c\left(P^{\prime}\right)$. Then also $\mathrm{P}^{\prime}\left(\mathrm{E}^{\mathrm{c}}\right)+\mathrm{c}\left(\mathrm{P}^{\prime}\right) \leq \mathrm{P}^{*}\left(\mathrm{E}^{\mathrm{c}}\right)$.

Because $\mathrm{P}^{*}$ is a probability measure, $\mathrm{P}^{*}(\mathrm{E})+\mathrm{P}^{*}\left(\mathrm{E}^{\mathrm{c}}\right)=1$. Consequently, $\mathrm{P}(\mathrm{E})+\mathrm{c}(\mathrm{P})+\mathrm{P}^{\prime}\left(\mathrm{E}^{\mathrm{c}}\right)+\mathrm{c}\left(\mathrm{P}^{\prime}\right) \leq 1$.

We thus obtain that the sum of the matching probabilities for $E$ and $E^{c}$ in the gain domain should not be more than 1 ; therefore, $0 \leq \mathrm{BC}^{+}(\mathrm{E})$.

Result 10. VM predicts $\mathrm{TA}^{+}, \mathrm{ITA}^{-} \leq 0 \leq \mathrm{TA}^{-}, \mathrm{ITA}^{+}$
Proof: Let us define $\mathrm{P}^{*} \in\{\mathrm{P} \in \Delta: \mathrm{c}(\mathrm{P})=0\}$.
We must have for any event $\mathrm{E}: \min _{\mathrm{P} \in \Delta}(\mathrm{P}(\mathrm{E})+\mathrm{c}(\mathrm{P})) \leq \mathrm{P}^{*}(\mathrm{E})$, which implies
$\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{1}\right)+\mathrm{c}(\mathrm{P})\right)+\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{2}\right)+\mathrm{c}(\mathrm{P})\right)+\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{3}\right)+\mathrm{c}(\mathrm{P})\right) \leq 1$, and therefore $\mathrm{TA}^{+} \leq 0$.

Similarly, it implies
$\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{12}\right)+\mathrm{c}(\mathrm{P})\right)+\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{23}\right)+\mathrm{c}(\mathrm{P})\right)+\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{13}\right)+\mathrm{c}(\mathrm{P})\right) \leq 2$,
and therefore $0 \leq$ ITA $^{+}$.
For losses, we must have for any event $\mathrm{E}: \min _{\mathrm{P} \in \Delta}(\mathrm{P}(\mathrm{E}) \mathrm{z}+\mathrm{c}(\mathrm{P})) \leq \mathrm{P} *(\mathrm{E}) \mathrm{z}$, which implies
$\left[\min _{P \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{1}\right) \mathrm{z}+\mathrm{c}(\mathrm{P})\right)\right] / \mathrm{z}+\left[\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{2}\right) \mathrm{z}+\mathrm{c}(\mathrm{P})\right)\right] / \mathrm{z}+\left[\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{3}\right) \mathrm{z}+\right.\right.$ $\mathrm{c}(\mathrm{P}))] / \mathrm{z} \geq 1$,
and
$\left[\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{1}\right) \mathrm{z}+\mathrm{P}\left(\mathrm{E}_{2}\right) \mathrm{z}+\mathrm{c}(\mathrm{P})\right)\right] / \mathrm{z}+\left[\min _{\mathrm{P} \in \Delta}\left(\mathrm{P}\left(\mathrm{E}_{1}\right) \mathrm{z}+\mathrm{P}\left(\mathrm{E}_{3}\right) \mathrm{z}+\mathrm{c}(\mathrm{P})\right)\right] / \mathrm{z}+$ $\left[\min _{P \in \Delta}\left(P\left(E_{2}\right) z+P\left(E_{3}\right) z+c(P)\right)\right] / z \geq 2$,
and therefore $\mathrm{ITA}^{-} \leq 0 \leq \mathrm{TA}^{-}$.

## A.4. The smooth model for ambiguity (KMM)

In this section, we again consider 3 outcomes: $\mathrm{x}, 0$, and $-\mathrm{x}($ where $\mathrm{x}>0$ ). We also assume that $\mathrm{U}(\mathrm{x})=1, \mathrm{U}(0)=0$, and $\mathrm{U}(-\mathrm{x})=\mathrm{z}$. with $\mathrm{z}<0$.

Lemma 2: If $\varphi$ is concave, $x_{E} 0 \sim x_{p} 0$ implies $p \leq \int_{\Pi} P(E) d \mu$ and $-x_{E} 0 \sim-x_{q} 0$
implies
$q \geq \int_{\Pi} P(E) d \mu$. If $\varphi$ is convex, $x_{E} 0 \sim x_{p} 0$ implies $p \geq \int_{\Pi} P(E) d \mu$ and $-x_{E} 0 \sim-x_{q} 0$ implies $\mathrm{q} \leq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu$.

## Proof:

$\mathrm{x}_{\mathrm{E}} 0 \sim \mathrm{x}_{\mathrm{p}} 0$ implies $\varphi(\mathrm{p})=\int_{\Pi} \varphi(\mathrm{P}(\mathrm{E})) \mathrm{d} \mu$.
Concavity of $\varphi$ implies $\int_{\Pi} \varphi(\mathrm{P}(\mathrm{E})) \mathrm{d} \mu \leq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu\right)$.
Therefore $\varphi(\mathrm{p}) \leq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu\right)$.
$\varphi$ is strictly increasing. As a consequence, $p \leq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu$.

On the contrary, convexity of $\varphi$ implies $\int_{\Pi} \varphi(\mathrm{P}(\mathrm{E})) \mathrm{d} \mu \geq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu\right)$.

Therefore $\varphi(\mathrm{p}) \geq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu\right)$.
$\varphi$ is strictly increasing. As a consequence, $p \geq \int_{\Pi} P(E) d \mu$.

Moreover, $-\mathrm{x}_{\mathrm{E}} 0 \sim-\mathrm{x}_{\mathrm{q}} 0$ implies $\varphi(\mathrm{qz})=\int_{\Pi} \varphi(\mathrm{P}(\mathrm{E}) \mathrm{z}) \mathrm{d} \mu$.
Concavity of $\varphi$ implies $\int_{\Pi} \varphi(\mathrm{P}(\mathrm{E}) \mathrm{z}) \mathrm{d} \mu \leq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{zd} \mu\right)$.
Therefore $\varphi(\mathrm{qz}) \leq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{Ez}) \mathrm{d} \mu\right)$.
$\varphi$ is strictly increasing. As a consequence, $\mathrm{qz} \leq \int_{\Pi} \mathrm{P}(\mathrm{E}) z d \mu$.
Dividing by $\mathrm{z}<0$ gives $\mathrm{q} \geq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu$.

On the contrary, convexity of $\varphi$ implies $\int_{\Pi} \varphi(\mathrm{P}(\mathrm{E}) \mathrm{z}) \mathrm{d} \mu \geq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{zd} \mu\right)$.
Therefore $\varphi(\mathrm{qz}) \geq \varphi\left(\int_{\Pi} \mathrm{P}(\mathrm{Ez}) \mathrm{d} \mu\right)$.
$\varphi$ is strictly increasing. As a consequence, $q z \geq \int_{\Pi} P(E) z d \mu$.
Dividing by $\mathrm{z}<0$ gives $\mathrm{q} \leq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu$.

Result 11. $\varphi$ concave implies $\mathrm{BC}^{-}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{+}(\mathrm{E})$ and $\varphi$ convex implies
$\mathrm{BC}^{+}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{-}(\mathrm{E})$.

## Proof:

Define $\mathrm{p}, \mathrm{s}, \mathrm{q}$ and r by $\mathrm{x}_{\mathrm{E}} 0 \sim \mathrm{x}_{\mathrm{p}} 0, \mathrm{x}_{\mathrm{E}}{ }^{\mathrm{c}} 0 \sim \mathrm{x}_{\mathrm{s}} 0,-\mathrm{x}_{\mathrm{E}} 0 \sim-\mathrm{x}_{\mathrm{q}} 0$ and $-\mathrm{x}_{\mathrm{E}}{ }^{\mathrm{c}} 0 \sim-\mathrm{x}_{\mathrm{r}} 0$.
According to Lemma 2, $\varphi$ concave implies $\mathrm{q} \geq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu$ and $\mathrm{r} \geq \int_{\Pi}(1-$ $\mathrm{P}(\mathrm{E})) \mathrm{d} \mu$ and therefore implies $\mathrm{q}+\mathrm{r} \geq 1$. It also implies $\mathrm{p} \leq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu$ and $\mathrm{s} \leq \int_{\Pi}$ $(1-\mathrm{P}(\mathrm{E})) \mathrm{d} \mu$ and therefore $\mathrm{p}+\mathrm{s} \leq 1 . \mathrm{BC}^{-}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{+}(\mathrm{E})$ follows.
Similarly, according to Lemma $2, \varphi$ convex implies $q \leq \int_{\Pi} P(E) d \mu$ and $r \leq \int_{\Pi}(1$ $-\mathrm{P}(\mathrm{E})) \mathrm{d} \mu$ and therefore implies $\mathrm{q}+\mathrm{r} \leq 1$. It also implies $\mathrm{p} \geq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu$ and $\mathrm{s} \geq$ $\int_{\Pi}(1-\mathrm{P}(\mathrm{E})) \mathrm{d} \mu$ and therefore $\mathrm{p}+\mathrm{s} \geq 1 . \mathrm{BC}^{-}(\mathrm{E}) \geq 0 \geq \mathrm{BC}^{+}(\mathrm{E})$ follows.

Result 12. $\varphi$ concave implies $\mathrm{TA}^{+}, \mathrm{ITA}^{-} \leq 0 \leq \mathrm{TA}^{-}, \mathrm{ITA}^{+}$but $\varphi$ convex implies $\mathrm{TA}^{-}, \mathrm{ITA}^{+} \leq 0 \leq \mathrm{TA}^{+}, \mathrm{ITA}^{-}$.

## Proof:

If $\mathrm{p}, \mathrm{q}$ and r are such that $\mathrm{x}_{\mathrm{E}} 0 \sim \mathrm{x}_{\mathrm{p}} 0, \mathrm{x}_{\mathrm{F}} 0 \sim \mathrm{x}_{\mathrm{q}} 0$, and $\mathrm{x}_{\mathrm{G}} 0 \sim \mathrm{x}_{\mathrm{r}} 0$ (with $\mathrm{E}, \mathrm{F}$, and G a partition of $S$ ), then if $\varphi$ is convex, Lemma 2 implies that $\mathrm{p}+\mathrm{q}+\mathrm{r} \geq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{F}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{G}) \mathrm{d} \mu=1$, and hence, $\mathrm{TA}^{+} \geq 0$.

But if $\varphi$ is concave, Lemma 2 implies that
$\mathrm{p}+\mathrm{q}+\mathrm{r} \leq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{F}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{G}) \mathrm{d} \mu=1$, and hence, $\mathrm{TA}^{+} \leq 0$.

If $\mathrm{p}, \mathrm{q}$ and r are such that $-\mathrm{x}_{\mathrm{E}} 0 \sim-\mathrm{x}_{\mathrm{p}} 0,-\mathrm{x}_{\mathrm{F}} 0 \sim-\mathrm{x}_{\mathrm{q}} 0$, and $-\mathrm{x}_{\mathrm{G}} 0 \sim-\mathrm{x}_{\mathrm{r}} 0$ (with E , $F$, and $G$ a partition of $S$ ), then if $\varphi$ is convex, Lemma 2 implies that $\mathrm{p}+\mathrm{q}+\mathrm{r} \leq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{F}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{G}) \mathrm{d} \mu=1$, and hence, $\mathrm{TA}^{-} \leq 0$. But if $\varphi$ is concave, Lemma 2 implies that $\mathrm{p}+\mathrm{q}+\mathrm{r} \geq \int_{\Pi} \mathrm{P}(\mathrm{E}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{F}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{G}) \mathrm{d} \mu=1$, and hence, $\mathrm{TA}^{-} \geq 0$.

If $\mathrm{p}, \mathrm{q}$ and r are such that $\mathrm{x}_{\mathrm{E}}{ }^{\mathrm{c}} 0 \sim \mathrm{x}_{\mathrm{p}} 0, \mathrm{x}_{\mathrm{F}}{ }^{\mathrm{c}} 0 \sim \mathrm{x}_{\mathrm{q}} 0$, and $\mathrm{x}_{\mathrm{G}}{ }^{\mathrm{c}} 0 \sim \mathrm{x}_{\mathrm{r}} 0$ (with $\mathrm{E}, \mathrm{F}$, and G a partition of $S$ ), then if $\varphi$ is convex, Lemma 2 implies that $p+q+r \geq \int_{\Pi} P(F \cup G) d \mu+\int_{\Pi} P(E \cup G) d \mu+\int_{\Pi} P(E \cup F) d \mu=2$, and hence, ITA $^{+}$ $\leq 0$.
But if $\varphi$ is concave, Lemma 2 implies that
$\mathrm{p}+\mathrm{q}+\mathrm{r} \leq \int_{\Pi} \mathrm{P}(\mathrm{F} \cup G) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{E} \cup G) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{E} \cup F) \mathrm{d} \mu=2$, and hence, ITA $^{+}$ $\geq 0$.

If $\mathrm{p}, \mathrm{q}$ and r are such that $-\mathrm{x}_{\mathrm{E}}{ }^{\mathrm{c}} 0 \sim-\mathrm{x}_{\mathrm{p}} 0,-\mathrm{x}_{\mathrm{F}}{ }^{\mathrm{c}} 0 \sim-\mathrm{x}_{\mathrm{q}} 0$, and $-\mathrm{x}_{\mathrm{G}}{ }^{\mathrm{c}} 0 \sim-\mathrm{x}_{\mathrm{r}} 0$ (with E, F, and G a partition of $S$ ), then if $\varphi$ is convex, Lemma 2 implies that $\mathrm{p}+\mathrm{q}+\mathrm{r} \leq \int_{\Pi} \mathrm{P}(\mathrm{F} \cup \mathrm{G}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{E} \cup G) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{E} \cup F) \mathrm{d} \mu=2$, and hence, ITA $^{-}$ $\geq 0$.

But if $\varphi$ is concave, Lemma 2 implies that
$\mathrm{p}+\mathrm{q}+\mathrm{r} \geq \int_{\Pi} \mathrm{P}(\mathrm{F} \cup \mathrm{G}) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{E} \cup G) \mathrm{d} \mu+\int_{\Pi} \mathrm{P}(\mathrm{E} \cup F) \mathrm{d} \mu=2$, and hence, ITA $^{-}$ $\leq 0$.

## A.5. Choquet expected utility (CEU)

Result 13. CEU predicts $\mathrm{BC}^{-}(\mathrm{E})=\mathrm{BC}^{+}(\mathrm{E})$. No further restrictions on sign.
Proof: Let $\mathrm{p}, \mathrm{s}, \mathrm{q}$ and r be defined by $\mathrm{x}_{\mathrm{E}} 0 \sim \mathrm{x}_{\mathrm{p}} 0, \mathrm{x}_{\mathrm{E}}{ }^{\mathrm{c}} 0 \sim \mathrm{x}_{\mathrm{s}} 0,-\mathrm{x}_{\mathrm{E}} 0 \sim-\mathrm{x}_{\mathrm{q}} 0$ and $-\mathrm{x}_{\mathrm{E}}{ }^{\mathrm{c}} 0 \sim-\mathrm{x}_{\mathrm{r}} 0$. Under CEU, this implies $\mathrm{p}=\mathrm{w}^{-1}(\mathrm{~W}(\mathrm{E})), \mathrm{s}=\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}^{\mathrm{c}}\right)\right)$, $r=w^{-1}(W(E)), q=w^{-1}\left(W\left(E^{c}\right)\right)$. Therefore $q+r-1=p+s-1$. It is straightforward that with no further conditions on W and $\mathrm{w}^{-1}$ than that they are increasing, $\mathrm{BC}^{-}(\mathrm{E})$ and $\mathrm{BC}^{+}(\mathrm{E})$ can be of any sign.

Result 14. CEU predicts $\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)+\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right) \leq 1$. No further restriction on signs.

## Proof:

$\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)=\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{i}}\right)+\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{j}}\right)-\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{ij}}\right)$ and $\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)=1-$ $w^{-1} \circ W\left(E_{k j}\right)-w^{-1} \circ W\left(E_{i k}\right)+w^{-1} \circ W\left(E_{k}\right)($ for $k \neq i, j)$.
The only property that we can use is that $\mathrm{w}^{-1} \circ \mathrm{~W}$ is increasing. As a consequence, there is no restriction on the sign of $\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$ and $\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)$ but:
$\mathrm{LA}^{+}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)+\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)=\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{i}}\right)+\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{j}}\right)-\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{ij}}\right)+1-$
$w^{-1} \circ W\left(E_{k j}\right)-w^{-1} \circ W\left(E_{i k}\right)+w^{-1} \circ W\left(E_{k}\right)=1-\left(w^{-1} \circ W\left(E_{i j}\right)-w^{-1} \circ W\left(E_{i}\right)+\right.$
$\left.\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{kj}}\right)-\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{j}}\right)+\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{ik}}\right)-\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{k}}\right)\right) \leq 1$ 。

Result 15. CEU predicts $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right)+\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right) \leq 1$. No further restriction on signs.

## Proof:

$\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{k}}\right)=1-\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{kj}}\right)-\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{ik}}\right)+\mathrm{w}^{-1} \circ \mathrm{~W}\left(\mathrm{E}_{\mathrm{k}}\right)$ and $\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{k}}\right)=$ $w^{-1} \circ W\left(E_{i}\right)+w^{-1} \circ W\left(E_{j}\right)-w^{-1} \circ W\left(E_{i j}\right)($ for $k \neq i, j)$.
From the preceding result, we conclude that there is no restriction on the sign of $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right)$ and $\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right)$ but $\mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right)+\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right) \leq 1$.

Result 16. CEU implies TA ${ }^{+}=\mathrm{ITA}^{-}, \mathrm{TA}^{-}=\mathrm{ITA}^{+}$, and $\mathrm{TA}^{+}+\mathrm{ITA}^{+} \leq 1$
Proof: Under CEU, $\mathrm{x}_{\mathrm{E} 1} 0 \sim \mathrm{x}_{\mathrm{p} 1} 0, \mathrm{x}_{\mathrm{E} 2} 0 \sim \mathrm{x}_{\mathrm{p} 2} 0, \mathrm{x}_{\mathrm{E} 3} 0 \sim \mathrm{x}_{\mathrm{p} 3} 0,-\mathrm{x}_{\mathrm{E} 23} 0 \sim-\mathrm{x}_{\mathrm{q} 1} 0$,
$-\mathrm{x}_{\mathrm{E} 13} 0 \sim-\mathrm{x}_{\mathrm{q} 2} 0,-\mathrm{x}_{\mathrm{E} 12} 0 \sim-\mathrm{x}_{\mathrm{q} 3} 0$, imply $\mathrm{p}_{\mathrm{i}}=1-\mathrm{q}_{\mathrm{i}}=\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}_{\mathrm{i}}\right)\right)$ for $\mathrm{i} \in\{1,2,3\}$.
Therefore $\mathrm{TA}^{+}=$ITA $^{-}$.
Similarly, $-\mathrm{x}_{\mathrm{E} 1} 0 \sim-\mathrm{x}_{\mathrm{p} 1} 0,-\mathrm{x}_{\mathrm{E} 2} 0 \sim-\mathrm{x}_{\mathrm{p} 2} 0,-\mathrm{x}_{\mathrm{E} 3} 0 \sim-\mathrm{x}_{\mathrm{p} 3} 0, \mathrm{x}_{\mathrm{E} 23} 0 \sim \mathrm{x}_{\mathrm{q} 1} 0, \mathrm{x}_{\mathrm{E} 13} 0 \sim$ $\mathrm{x}_{\mathrm{q} 2} 0, \mathrm{x}_{\mathrm{E} 12} 0 \sim \mathrm{x}_{\mathrm{q} 3} 0$, imply $\mathrm{p}_{\mathrm{i}}=1-\mathrm{q}_{\mathrm{i}}=\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{~S}-\mathrm{E}_{\mathrm{i}}\right)\right)$ for $\mathrm{i} \in\{1,2,3\}$.
Therefore $\mathrm{TA}^{-}=\mathrm{ITA}^{+}$.
Moreover, $\mathrm{TA}^{+}+\mathrm{ITA}^{+}=1-\left(\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}_{12}\right)\right)-\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}_{1}\right)\right)+\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}_{23}\right)\right)-\right.$ $\left.\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}_{2}\right)\right)+\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}_{13}\right)\right)-\mathrm{w}^{-1}\left(\mathrm{~W}\left(\mathrm{E}_{3}\right)\right)\right) \leq 1$ (because $\mathrm{w}^{-1} \circ \mathrm{~W}$ is increasing). It is straightforward that this only property of $\mathrm{w}^{-1} \circ \mathrm{~W}$ does not restrict the sign of $\mathrm{TA}^{+}$and $\mathrm{ITA}^{+}$any further.

## A.6. Prospect theory (PT)

Result 17. PT does not predict anything about $\mathrm{BC}^{-}(\mathrm{E})$ and $\mathrm{BC}^{+}(\mathrm{E})$.
$\mathrm{BC}^{+}(\mathrm{E})=\left(\mathrm{w}^{+}\right)^{-1}\left(\mathrm{~W}^{+}(\mathrm{E})\right)+\left(\mathrm{w}^{+}\right)^{-1}\left(\mathrm{~W}^{+}(\mathrm{S}-\mathrm{E})\right)$ and
$\mathrm{BC}^{-}(\mathrm{E})=\left(\mathrm{w}^{-}\right)^{-1}\left(\mathrm{~W}^{-}(\mathrm{E})\right)+\left(\mathrm{w}^{-}\right)^{-1}\left(\mathrm{~W}^{-}(\mathrm{S}-\mathrm{E})\right)$.
Proof: Ambiguity-generated insensitivity does not predict anything about the relationship between the weight assign to an event and to its complement. And PT does not assume any special link between the weighting functions for losses than for gains.

Result 18. PT with ambiguity-generated insensitivity predicts that $\mathrm{LA}^{+}(\mathrm{Ei}, \mathrm{Ej})$, $\mathrm{LA}^{-}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right), \mathrm{UA}^{+}\left(\mathrm{E}_{\mathrm{i}}\right)$, and $\mathrm{UA}^{-}\left(\mathrm{E}_{\mathrm{i}}\right)$ are all positive but does not predict any specific link between the positive indexes and the respective indexes for losses.

Proof: Recall that a decision maker exhibits ambiguity-generated insensitivity if for $\mathrm{s}=+,-$, (i) $\mathrm{W}^{s}\left(\mathrm{E}_{\mathrm{i}}\right)=\mathrm{w}^{\mathrm{s}}\left(\mathrm{p}_{\mathrm{i}}\right)$ and $\mathrm{W}^{\mathrm{s}}\left(\mathrm{E}_{\mathrm{j}}\right)=\mathrm{w}^{\mathrm{s}}\left(\mathrm{q}_{\mathrm{j}}\right)$ imply that $\mathrm{W}^{\mathrm{s}}\left(\mathrm{E}_{\mathrm{ij}}\right) \leq$ $w^{s}\left(p_{i}+p_{j}\right)$ provided that $w^{s}\left(p_{i}+p_{j}\right)$ is bounded away from 1 , and (ii) $W^{s}\left(E_{i j}\right)=$ $w^{s}\left(p_{i j}\right)$ and $W^{s}\left(E_{i k}\right)=w^{s}\left(p_{i k}\right)$ imply that $W^{s}\left(E_{i}\right) \geq w^{s}\left(p_{i j}+p_{i k}-1\right)$ provided that $W^{s}\left(E_{i}\right)$ is bounded away from 0 .

The following proof is the same for all sign s.
From (i), we can derive that the matching probabilities for $E_{i}$ and $E_{j}$ are $p_{i}$ and $p_{j}$ respectively but the matching probability $p_{i j}$ of $E_{i j}$ must be less than $p_{i}+p_{j}$ (because $\left.W^{s}\left(E_{i j}\right) \leq w^{s}\left(p_{i}+p_{j}\right)\right)$. It follows that LA ${ }^{\mathrm{s}}\left(\mathrm{E}_{\mathrm{i}}, \mathrm{E}_{\mathrm{j}}\right)=\mathrm{p}_{\mathrm{i}}+\mathrm{p}_{\mathrm{j}}-\mathrm{p}_{\mathrm{ij}}$ must be positive.
From (ii), we can derive that the matching probabilities of $\mathrm{E}_{\mathrm{ij}}$ and $\mathrm{E}_{\mathrm{ik}}$ are $\mathrm{p}_{\mathrm{ij}}$ and $p_{i k}$ respectively (for any sign $s$ ) but the matching probability $p_{i}$ for $E_{i}$ must be more than $p_{i j}+p_{i k}-1$ (because $W^{s}\left(E_{i}\right) \geq w^{s}\left(p_{i j}+p_{i k}-1\right)$ ). It follows that $\mathrm{UA}^{\mathrm{s}}\left(\mathrm{E}_{\mathrm{i}}\right)=1-\mathrm{p}_{\mathrm{ij}}-\mathrm{p}_{\mathrm{ik}}+\mathrm{p}_{\mathrm{i}} \geq 0$.

Result 19. PT with ambiguity-generated insensitivity predicts that $0 \leq \mathrm{TA}^{+}+$ $\mathrm{ITA}^{+} \leq 1$ and $0 \leq \mathrm{ITA}^{-}+\mathrm{TA}^{-} \leq 1$ but does not predict any specific link between the positive indexes and the respective indexes for losses.

Proof: TA $^{\mathrm{s}}+$ ITA $^{\mathrm{s}}=\mathrm{p}_{\mathrm{i}}+\mathrm{p}_{\mathrm{j}}+\mathrm{p}_{\mathrm{k}}-1+2-\mathrm{p}_{\mathrm{ij}}-\mathrm{p}_{\mathrm{ik}}-\mathrm{p}_{\mathrm{jk}} \geq \mathrm{p}_{\mathrm{k}}+1-\mathrm{p}_{\mathrm{ik}}-\mathrm{p}_{\mathrm{jk}} \geq 0$ where the first inequality comes from (i) and the second from (ii). Moreover, the increasingness of $W^{s}$ and $w^{s}$ implies TA ${ }^{s}+$ ITA $^{s}=1+p_{i}+p_{j}+$ $\mathrm{p}_{\mathrm{k}}-\mathrm{p}_{\mathrm{ij}}-\mathrm{p}_{\mathrm{ik}}-\mathrm{p}_{\mathrm{jk}} \leq 1$.

## A.7. Vector expected utility (VEU)

We consider two nonzero outcomes x and -x and we take $\mathrm{U}(0)=0, \mathrm{U}(\mathrm{x})=1$, and $\mathrm{U}(-\mathrm{x})=\mathrm{z}$ with $\mathrm{z}<0$. Under VEU, $\mathrm{x}_{\mathrm{E}} 0 \sim \mathrm{x}_{\mathrm{p}} 0$ and $-\mathrm{x}_{\mathrm{E}} 0 \sim-\mathrm{x}_{\mathrm{q}} 0$ imply $\mathrm{p}=$ $\mathrm{P}(\mathrm{E})+\mathrm{A}\left(\left(\zeta_{i}(\mathrm{E}) \mathrm{P}(\mathrm{E})\right)_{0 \leq i \leq n}\right)$ and $\mathrm{q}=\mathrm{P}(\mathrm{E})+\mathrm{A}\left(\left(\zeta_{i}(\mathrm{E}) \mathrm{P}(\mathrm{E}) \mathrm{z}\right)_{0 \leq i<n}\right) / \mathrm{z}$ respectively.

Result 20. If A is negative, then $\mathrm{BC}^{-}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{+}(\mathrm{E})$. If A is positive, then $\mathrm{BC}^{+}(\mathrm{E}) \leq 0 \leq \mathrm{BC}^{-}(\mathrm{E})$.

Proof: Under VEU, $\mathrm{BC}^{-}(\mathrm{E})=-\mathrm{A}\left(\left(\zeta_{\mathrm{i}}(\mathrm{E}) \mathrm{P}(\mathrm{E}) \mathrm{z}\right)_{0 \leq i<\mathrm{n}}\right) / \mathrm{z}-$
$\mathrm{A}\left(\left(\zeta_{\mathrm{i}}(\mathrm{E})(1-\mathrm{P}(\mathrm{E})) \mathrm{z}\right)_{0 \leq i<n}\right) / \mathrm{z}$.
$\mathrm{BC}^{+}(\mathrm{E})=-\mathrm{A}\left(\left(\zeta_{i}(\mathrm{E}) \mathrm{P}(\mathrm{E}) \mathrm{z}\right)_{0 \leq i<n}\right)-\mathrm{A}\left(\left(\zeta_{\mathrm{i}}(\mathrm{E})(1-\mathrm{P}(\mathrm{E})) \mathrm{z}\right)_{0 \leq i<\mathrm{n}}\right)$.

Result 21. If A is negative, then $\mathrm{TA}^{+}, \mathrm{ITA}^{-} \leq 0 \leq \mathrm{TA}^{-}, \mathrm{ITA}^{+}$. If A is positive, then $\mathrm{TA}^{-}, \mathrm{ITA}^{+} \leq 0 \leq \mathrm{TA}^{+}$, $\mathrm{ITA}^{-}$.
Proof: Consider a partition of $S$ into $\mathrm{E}_{1}, \mathrm{E}_{2}$, and $\mathrm{E}_{3}$. Under VEU,

$$
\begin{aligned}
& \mathrm{TA}^{+}=\mathrm{A}\left(\left(\zeta_{i}\left(\mathrm{E}_{1}\right) \mathrm{P}\left(\mathrm{E}_{1}\right)\right)_{0 \leq i<n}\right)+\mathrm{A}\left(\left(\zeta_{i}\left(\mathrm{E}_{2}\right) \mathrm{P}\left(\mathrm{E}_{2}\right)\right)_{0 \leq i<\mathrm{n}}\right)+\mathrm{A}\left(\left(\zeta_{i}\left(\mathrm{E}_{3}\right) \mathrm{P}\left(\mathrm{E}_{3}\right)\right)_{0 \leq i<n}\right) . \\

$$

The result follows.

## A.8. Additivity indexes

Result 22. Violations of any 4 of the 5 types of additivity do not imply a violation of the $5^{\text {th }}$ one.

Proof: Let us consider a nonzero outcome x and a partition of S in 3 events $E_{1}, E_{2}, E_{3}$. The third column of Table A. 1 is an example of an additive
situation. The others are examples of violations of 4 types of additivity, not implying a violation of the $5^{\text {th }}$ one.
